## 9.3. Monday for MAT4002

## Reviewing.

- 1. Homotopy: we denote the homotopic function pair as  $f \cong g$ .
- 2. If  $Y \subseteq \mathbb{R}^n$  is convex, then the set of continuous functions  $f: X \to Y$  form a single equivalence class, i.e., {continuous functions  $f: X \to Y$ }/ $\sim$  has only one element

## 9.3.1. Remarks on Homotopy

**Proposition 9.4** Consider four continous mappings

$$W \xrightarrow{f} X$$
,  $X \xrightarrow{g} Y$ ,  $X \xrightarrow{h} Y$ ,  $Y \xrightarrow{k} Z$ .

If  $g \cong h$ , then

$$g \circ f \cong h \circ f$$
,  $k \circ g \cong k \circ h$ 

*Proof.* Suppose there exists the homotopy  $H: g \cong h$ , then  $k \circ H: X \times I \to Z$  gives the momotopy between  $k \circ g$  and  $k \circ h$ .

Simiarly, 
$$H \circ (f \times id_I) : W \times I \to Y$$
 gives the homotopy  $g \circ f \simeq h \circ f$ .

**Definition 9.4** [Homotopy Equivalence] Two topological spaces X and Y are **homotopy** equivalent if there are continuous maps  $f: X \to Y$ , and  $g: Y \to X$  such that

$$g \circ f \simeq \mathrm{id}_{X \to X}$$

$$f \circ g \simeq \mathrm{id}_{Y \to Y}$$

which is denoted as  $X \simeq Y$ .

- 1. If  $X \cong Y$  are homeomorphic, then they are homotopic equivalent.
- 2. The homotopy equivalence  $X \simeq Y$  gives a bijection between  $\{\phi : \text{continuous } W \to X\}/\sim$  and  $\{\phi : \text{continuous } W \to Y\}/\sim$ , for any given topological space W.

3. The homotopy equivalence  $X \simeq Y$  forms an equivalence relation between topological spaces

Compared with homeomorphism, some properties are lost when consider the homotopy equivalence.

**Definition 9.5** [Contractible] The topological space X is **contractible** if it is homotopy equivalent to a point  $\{c\}$ .

In other words, there exists continuous mappings f, g such that

$$\{c\} \xrightarrow{f} X \xrightarrow{g} \{c\}, g \circ f \simeq id_{\{c\}}$$
  
 $X \xrightarrow{g} \{c\} \xrightarrow{f} X, f \circ g \simeq id_{X}$ 

Fortunately, the condition  $g \circ f \simeq \operatorname{id}_{\{c\}}$  follows naturally; and since  $X \cong X$ , we can find f,g such that  $f \circ g = c_y$  for some  $y \in X$ , where  $c_y : X \to X$  is a constant function  $c_y(x) = y, \forall x \in X$ .

Therefore, to check *X* is contractible, it suffices to check  $c_y \simeq id_X, \forall y \in X$ .

**Example 9.1** 1.  $X = \mathbb{R}^2$  is contractible:

It suffices to show that the mapping  $f(x) = x, \forall x \in \mathbb{R}^2$  is homotopic to the constant function  $g(x) = (0,0), \forall x \in \mathbb{R}^2$ , i.e.,  $g = c_{(0,0)}$ .

Consider the continuous mapping  $H(\mathbf{x},t) = t f(\mathbf{x})$ , with

$$H(x,0) = c_{(0,0)}, H(x,1) = id_X$$

Therefore,  $c_{(0,0)} \simeq \mathrm{id}_X$ . Since  $c_{(0,0)} \simeq c_{\mathbf{y}}, \forall \mathbf{y} \in \mathbb{R}^2$ , we imply  $c_{\mathbf{y}} \simeq \mathrm{id}_X$  for any  $\mathbf{y} \in \mathbb{R}^2$ .

Therefore, X is contractible.

More generally, any convex  $X \subseteq \mathbb{R}^n$  is contractible.

 $S^1$  is not contractible, and we will see it in 3 weeks' time. In particular, we are not able to construct the continuous mapping

$$H: S^1 \times [0,1] \rightarrow S^1$$

such that

$$H(e^{2\pi ix}, 0) = e^{2\pi ix}, \quad H(e^{2\pi ix}, 1) = e^{2\pi i(0)} = 1$$

How about the mapping  $H(e^{2\pi ix},t)=e^{2\pi ixt}$ ? Unfortunately, it is not well-defined, since

$$H(e^{2\pi i(1)}, t) = e^{2\pi i t} = H(e^{2\pi i(0)}, t) = 1$$

and the equality is not true for  $t \neq 0,1$ .

**Definition 9.6** [Homotopy Retract] Let  $A \subseteq X$  and  $i : A \hookrightarrow X$  be an inclusion. We say A is a **homotopy retract** of X if there exists continuous mapping  $r : X \to A$  such that

$$r \circ i : A \hookrightarrow X \xrightarrow{r} A = id_A$$

$$i \circ r : X \xrightarrow{r} A \hookrightarrow X \simeq id_X$$

In particualr,  $A \simeq X$ .

■ Example 9.2 The 1-sphere  $S^1$  is a homotopy retract of Mobius band M. Let  $M = [0,1]^2/\sim$  and  $S^1 = [0,1]/\sim$ . Define the inclusion i and r as:

$$i: S^1 \hookrightarrow M$$

with 
$$[x] \mapsto [(x, \frac{1}{2})]$$

$$r: M \to S^1$$

with 
$$[(x,y)] \mapsto [x]$$

As a result

$$r \circ i = id_{S^1}, \quad i \circ r([(x, y)]) = [(x, 1/2)]$$

It suffices to show  $i \circ r \simeq id_M$ , where  $id_M([(x,y)]) = [(x,y)]$ .

Construct the continous mapping  $H: M \times I \rightarrow M$  with

$$H([(x,y)],t) := [(x,(1-t)y + t/2)]$$

To show the well-definedness of H, we need to check

$$H([(0,y)],t) = H([(1,1-y)],t), \quad \forall y \in [0,1]$$

It's clear that H gives a homotopy between  $i \circ r$  and  $\mathrm{id}_M$ , i.e.,  $i \circ r \simeq \mathrm{id}_M$ 

■ Example 9.3 The n-1-sphere  $S^{n-1}$  is a homotopy retract of  $\mathbb{R}^n \setminus \{\mathbf{0}\}$ :

We have the inclusion  $i: S^{n-1} \to \mathbb{R}^n \setminus \{0\}$  and

$$r: \mathbb{R}^n \setminus \{0\} \to \mathbb{S}^{n-1}$$
 with  $x \mapsto \frac{x}{\|x\|}$ 

Therefore,  $r \circ i = \mathrm{id}_{S^{n-1}}$  and  $i \circ r(x) = \frac{x}{\|x\|}$ .

It suffices to show that  $i \circ r \simeq \mathrm{id}_{\mathbb{R}^n \setminus \{0\}}$ . Consider the homotopy  $H(x,t) = t\mathbf{x} + (1-t)\mathbf{x}/\|\mathbf{x}\|$  such that

$$H(x,0) = i \circ r(x), \quad H(x,1) = x = id(x)$$

To show the well-definedness of H, we need to check  $H(x,t) \in \mathbb{R}^n \setminus \{\mathbf{0}\}$  for all  $\mathbf{x} \in \mathbb{R}^n \setminus \{\mathbf{0}\}$  and  $t \in [0,1]$ .

**Definition 9.7** [Homotopic Relative] Let  $A \subseteq X$  be topological spaces. We say  $f,g:X \to Y$  are homotopic relative to A if there eixsts  $H:X \times I \to Y$  such that

$$\begin{cases} H(x,0) = f(x) \\ H(x,1) = g(x) \end{cases} \text{ and } H(a,t) = f(a) = g(a), \forall a \in A$$
